Preliminaries

Include JSXGraph

- JSXGraph skeleton page:

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="UTF-8">
    <title>JSXGraph template</title>
    <meta content="text/html; charset=utf-8" http-equiv="Content-Type">
    <link href="https://cdn.jsdelivr.net/npm/jsxgraph@1.1.0/distrib/
      jsxgraph.css" rel="stylesheet" type="text/css" />
    <script src="https://cdn.jsdelivr.net/npm/jsxgraph@1.1.0/distrib/
      jsxgraphcore.js" type="text/javascript" charset="UTF-8"></script>

    <!-- The next line is optional: MathJax -->
    <script src="https://cdn.jsdelivr.net/npm/mathjax@3/es5/tex-chtml.js"
      id="MathJax-script" async></script>
  </head>
  <body>

    <div id="jxgbox" class="jxgbox" style="width:500px; height:200px;"></div>

    <script>
      var board = JXG.JSXGraph.initBoard('jxgbox', {boundingbox: [-5, 2, 5,
        -2]} );
    </script>

  </body>
</html>
```

- See JSXGraph handbook (in development): <https://ipesek.github.io/jsxgraphbook/>

Axes / Grid

- Grid is mostly obsolete
- `axis: true` creates default axes.
- There is also the element `axis`. It allows to create individual axes (in every direction).
- See also Murray Bourne's take on axes and grids: <https://www.intmath.com/cg3/jsxgraph-axes-ticks-grids.php>
- More information about ticks: <https://jsxgraph.org/wiki/index.php/Ticks>

Axis element

- <https://jsfiddle.net/2Lwdxvtf/2/>

```
const board = JXG.JSXGraph.initBoard('jxgbox', {
    boundingbox: [-5, 5, 5, -5], axis:false
});

board.create('axis', [[0,0], [0,1]], {
    visible: true,
    scalable: true,
    ticks: {
        type: 'linear',
        visible: true,
        drawZero: true,
        majorHeight: -1,
        minorHeight: 0,
        minorTicks: 0,
        label: {
            visible: true,
            anchorX: 'right',
            anchorY: 'middle',
            fontSize: 12,
            offset: [-6, 0]
        }
    },
    name: 'y',
    withLabel: true,
    label: {
        position: 'rt',
        offset: [-20, -10]
    }
});
```

- The axis looks like a grid by setting:

```
board.create('axis', [[0,0], [0,1]], {
    visible: false,
    ticks: {
        visible: true,
        drawZero: true,
        majorHeight: -1,
        minorHeight: 0,
        minorTicks: 0,
        label: {
            visible: false
        }
    }
});
```

Default axes

The default axes which are generated with the attribute `axis: true` can be styled using the board attributes `defaultAxes.x` and `defaultAxes.y`:

```
const board = JXG.JSXGraph.initBoard('jxgbox', {
    boundingbox: [-5, 5, 5, -5],
    axis:true,
    defaultAxes: {
        x: {
            ticks: {
                minorTicks: 0
            }
        },
        y: {
            ticks: {
                tickEndings: [1, 1],
                minorTicks: 4
            }
        }
    }
});
```

- See <https://jsfiddle.net/7jv9z4Ld/>

Non-standard scaling

- The most prominent example here is to have major ticks (and labels) for multiples of π . This can be realized by using the attributes `scale` and `scaleSymbol`, see <https://jsfiddle.net/tqf8vwoc/>.

```
const board = JXG.JSXGraph.initBoard('jxgbox', {
    boundingbox: [-15, 5, 15, -5],
    axis: true,
    defaultAxes: {
        x: {
            ticks: {
                scale: Math.PI,
                scaleSymbol: '\u03c0',
                ticksDistance: 1,
                insertTicks: false
            }
        }
    }
});
```

The symbol π is generated by using the UTF-16 code `0x03C0` for π in the form `\u03c0`.

Highlighting of elements

- If the mouse pointer / pen is close to a JSXGraph element, this element will be *highlighted* or can be dragged.
- The precision can be set with the attribute `JXG.Options.precision`, see <https://jsxgraph.org/docs/symbols/JXG.Options.html#.precision>.
- Starting from version 1.2.0 the precision can be set individually for every element.
- Among the attributes for highlighting are `highlightStrokeWidth`, `highlightStrokeColor`, `highlightStrokeOpacity`, `highlightFill...`, `highlightCssClass`. The latter attribute is for texts and images.

Disable highlighting for specific elements

```
// Turn off highlighting
var line = board.create('line', [[-2, -3], [3, 4]], {highlight: false});
```

See <https://jsfiddle.net/ujor4xbf/>

Combine a group of elements for highlighting

- Combined highlighting of objects seems to be impossible if triggered from *board events*.
- However, triggering combined highlighting from outside is possible, see <https://jsfiddle.net/92re5zo6/1/>

```
var p1 = board.create('point', [-3, -2]);
var p2 = board.create('point', [-1, 3]);
var p3 = board.create('point', [0, 1]);
var p4 = board.create('point', [2, -2]);
var line = board.create('line', [p1, p3]);

// JXG.Composition

var c = new JXG.Composition({
    p1: p1,
    p2: p2,
    p3: p3,
    p4: p4
});

function doit(highlight) {
    if (highlight) {
        c.highlight(true);
    } else {
```

```

        c.noHighlight();
    }
}

```

- Also possible without Composition element

Groups

- Combine a group of *points* with the element `group`.
- Then, dragging one point affects the other points, too.
- There are the following special points:
 - *translation points*: each point is translation point by default
 - *scale points*
 - *rotation points*
- Then there is a
 - *scaleCenter*
 - *rotationCenter*
- Centers are given by points, the string '`'centroid'`', or an array with coordinates.

```

var p1 = board.create('point', [-1, -2]);
var p2 = board.create('point', [2, -2]);
var p3 = board.create('point', [2, 2]);
var p4 = board.create('point', [-1, 2]);

var pol = board.create('polygon', [p1, p2, p3, p4], {fillColor: 'yellow'})
;
var G = board.create('group', [p1, p2, p3, p4]);
G.setRotationCenter(p2).setRotationPoints([p1]);
G.setScaleCenter('centroid').setScalePoints([p3, p4]);
G.setAttribute({size: 8});

```

- See <https://jsfiddle.net/jw81koze/1/>

How is a construction interpreted?

- Updates are triggered on every pointer move / down / up event.
- All updates run in a single thread.
- Exceptions, where functions are called asynchronously are:

- determine the size of a text element
- animations
- dumpToCanvas
- transitions, see <https://jsfiddle.net/jgdwpho8/>:

```
var p1 = board.create('point', [-1, -2]);
var p2 = board.create('point', [2, -2]);
var p3 = board.create('point', [2, 2]);
var p4 = board.create('point', [-1, 2]);
var pol = board.create('polygon', [p1, p2, p3, p4], {
  fillColor: 'yellow',
  highlightFillColor: 'blue',
  transitionDuration: 2000,
  hasInnerPoints: true
});
```

- Usually, it is suggested to load MathJax asynchronously. This might lead to problems, if JSXGraph constructions are loaded synchronously.

Accessing elements in one layer

- Elements in one layer are ordered chronological. That means, the last element is on top.
- This may be changed with the attribute `dragToTopOfLayer`, which places an element on top if dragged.
- See <https://jsfiddle.net/y1gf4de8/>

```
var li1 = board.create('line', [1, 1, 1], {strokeWidth: 20,
  dragToTopOfLayer: true});
var li2 = board.create('line', [1, -1, 1], {strokeWidth: 20, strokeColor:
  'red', dragToTopOfLayer: true});
```

Discussion and suggestion of further topics

- Please, make suggestion for a new element `vectorfield` at <https://github.com/jsxgraph/jsxgraph/issues/333>
- Topics of the January webinar: new features of v1.2.0
- Alpha blendings of colors: use hex `rgba` string like '`#ff000054`' or `strokeOpacity: 0.5`'.

Next webinar

The next webinar will be **Wednesday, January 20th, 2021 at 4 pm CET**
